

# PS704 Container Tracking Device

## About Device

The JT704-4G Container Tracker is an intelligent, concealed tracking device designed for containers, replacing vent covers without altering appearance. It supports GPS/LBS positioning, 2G/4G communication, and offers remote OTA upgrades and configuration.

With ultra-low power consumption and a 5-year standby life, it provides a secure, smart, and sustainable solution for container asset management.

## Feature Details

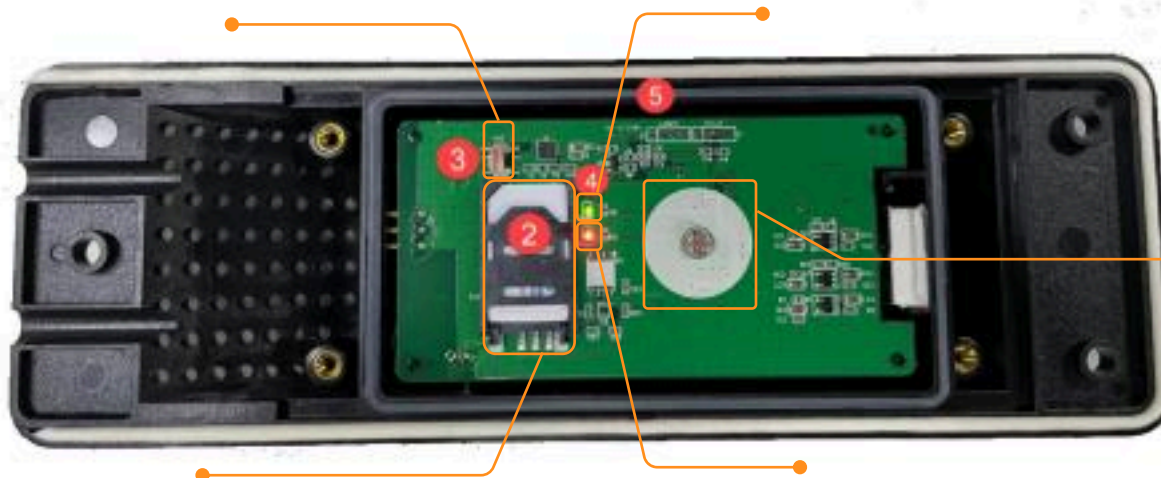

**Green LED:** Positioning indicator

Solid: Precise Positioning

Flicker: Best station Positioning

Off: Not Positioned

Sim Slot

Light Sensors

Sim Slot

**Red LED:** Network indicator

Flash: GPRS Connection in progress

Slow Flash: GPRS is connected

# Key Feature

01

## Fixed interval mode

The device wakes up at regular intervals configured and reports a piece of data to the platform before going to sleep.

02

## Tracking mode

The device operates continuously without hibernation, maintaining tracking mode even after restarts unless manually turned off by the user.

03

## Week mode

The device wakes up at scheduled times, reports 1 piece of data to the platform, and then re-enters hibernation to conserve power.

04

## Storage Mode

It can be woken up by disassembly or via commands like setting intervals, alarms, or exiting storage mode.

## Technical Feature

- **Alert:** The device can correct the timed wake-up time point, and can set up to 4 wake-up time points, which can better accurately locate and connect to the server. This feature can be set by SMS or platform commands.
- **Large-Capacity Battery:** Equipped with a high-capacity battery to ensure extended working hours, providing continuous tracking and monitoring capabilities.
- **Built-in Wireless Module:** Facilitates real-time online monitoring, allowing for immediate updates and ensuring seamless connectivity for effective asset management.

- **Integrated GPS Module:** The device has A-GPS function, when the terminal is connected to GPRS, you can use the A-GPS function to speed up the positioning speed of the satellite positioning module and improve the positioning accuracy.
- **Illegal Unlocking Alarm:** In normal working mode, the device wakes up every 24 hours by default and uploads a piece of position information (the location information includes: GSM signal strength, battery level, base station ID information, basic parameters of the device and other information).
